KEY WORDS: Global Environmental-Databases, Satellite, Remote Sensing, Atmosphere, Land, Oceans, Environment, International.

ABSTRACT:

The Committee on Earth Observation Satellites (CEOS) is an international organization charged with coordinating international civil spaceborne missions designed to observe and study planet Earth. Comprising 44 space agencies and other national and international organizations, CEOS is recognized as the major international forum for the coordination of Earth observation satellite programs and for the interaction of these programs with users of satellite data worldwide.

CEOS was created in 1984 in response to a recommendation from the Economic Summit of Industrialized Nations Working Group on Growth, Technology, and Employment's Panel of Experts on Satellite Remote Sensing. This group recognized the multidisciplinary nature of satellite Earth observation and the value of coordination across all proposed missions.

The CEOS members collect, maintain, apply, and make available data from space missions that encompass the atmospheric, terrestrial, and oceanographic fields. Collectively, these members possess petabytes of Earth observation data critical to understanding the Earth environment. Uses include monitoring oil slicks, evaluating human-induced changes to the atmosphere, determining mineral exploration areas, assessing the environmental effects of volcanic eruptions, measuring the growth of urban areas, determining where landscapes have changed because of urban growth trends, improving the efficiency of fishing as a world food stock, monitoring pest infestation, managing crop production, predicting climate and weather, and numerous other applications vital to industry, national infrastructures, and the world as a whole.

The vast amount of satellite obtained, environmental data the CEOS members possess represents a fertile resource for researchers worldwide to exploit.

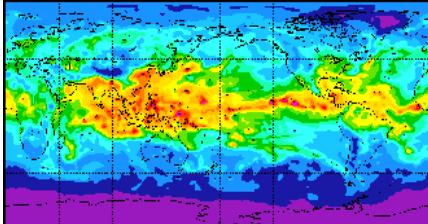

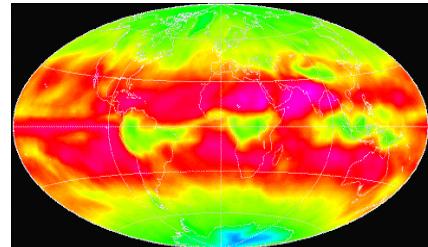

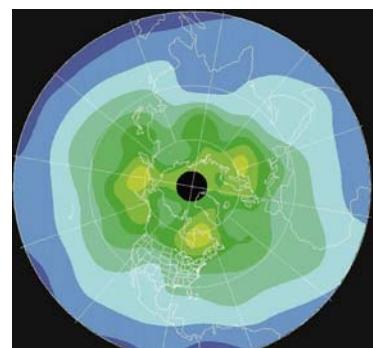

1. INTRODUCTION

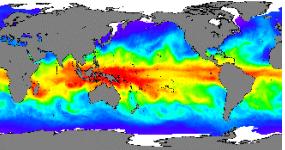

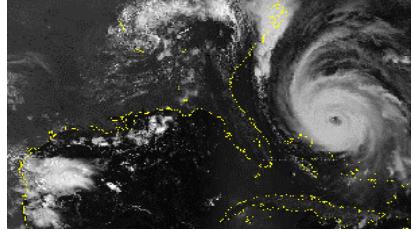

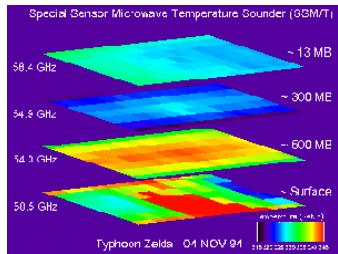

CEOS membership includes civil agencies and non-governmental organizations from around the world.¹ Several CEOS participants manage and provide Earth observation (EO) data products. A recent report commissioned by the CEOS Plenary directed the CEOS Working Group on Information Systems and Services (WGIS) to seek ways to improve the utilization of EO data managed by CEOS

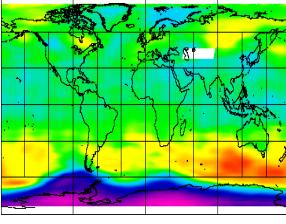

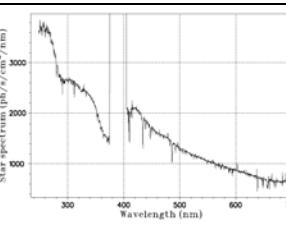

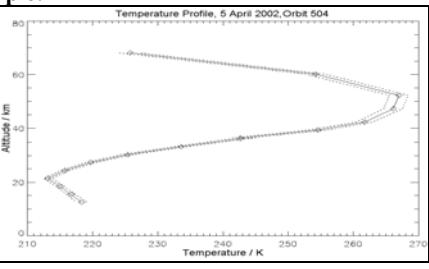

participants.² As a partial response to this guidance, the authors abstract and group within atmospheric, terrestrial and oceanographic scientific fields, the EO holdings offered by the CEOS participants. Within those fields we provide a description of the specific types of data in conjunction with data parameters such as temporal and spatial characteristics. We also describe access means for each data provider letting interested researchers seek further information or obtain data for their project use.

2. CONCLUSIONS

The civil government agencies and non-governmental organizations that comprise CEOS provide vast amounts of satellite data supporting environmental projects ranging from small tracts of land to entire ocean basins. Discovering these diverse holdings can often be challenging. This paper identifies and briefly describes atmospheric, terrestrial and oceanographic sources created from satellites and provides links for interested researchers to obtain data that may satisfy their project needs.
